13. Supplementary Notes Work done in association with Los Alamos Technical Associates					
14. Abstract The Phase II EBS results document the extent of environmental contamination believed to be present on McCormick Ranch. Explosive test areas having the greatest potential for containing soil contaminants were identified using the following geophysical survey methods: EM 31 terrain conductivity meter, magnetometer/gradiometer, and ground penetrating radar. From the geophysical surveys five areas were selected to conduct further environmental analysis. A total of 310 soil samples were collected from the five areas and 13 specific high explosive test sites. The samples were screened for semi-volatile organic compounds, PETN, TNT, TNT-degradation products, nitrates and radioactivity. Laboratory analyses were performed and no explosives or degradation products were identified. Semi-volatile organic compounds were found in 2 samples, manganese was detected in 3 samples, nitrates were discovered below soil action levels and radiation levels were below background. Consequently, it is unlikely that significant contamination exists.

QUANTERRA PROJECT NUMBER: 077428
PO/CONTRACT: 06

Mr. Jeff Johnson
Gram, Inc.
8500 Manual Blvd. NE, #B-370
Albuquerque, New Mexico 87112

Dear Mr. Johnson:

This report contains the analytical results for the ten soil samples which were received under chain of custody by Quanterra West Sacramento on 30 August 1994. These samples are associated with your McCormick Ranch, Kirkland AFB project.

The case narrative is an integral part of this report.

If you have any questions, please call me at (916) 374-4362.

Sincerely,

Diana L. Brooks
Project Manager

CASE NARRATIVE

QUANTERRA PROJECT NUMBER 077428

General Comments

The temperature blank associated with your samples was recorded as 3.5 deg C. The ambient temperature was 5.3 deg C.

Nitroaromatics and Nitramines by HPLC - Method 8330

The matrix spike/matrix spike duplicate has a tetryl recovery above the control limits. The samples were re-injected and the recoveries were confirmed.

Semivolatile Organics - Method 8270

The laboratory control sample has benzoic acid reported as NA. The actual value recovered (43%) is within the control limits. Noted in the QAPjP, this compound is flagged for a variance.

Due to electronic deliverable limitations, the library search data is available in hardcopy format only.

The method blank 2-Fluorobiphenyl surrogate recovery is above the control limits. Re-injections on different instruments have resulted in similar recoveries. The samples associated with this blank have no positive detections. The initial analysis has been reported.

Metals - Various Methods

The ICAP antimony matrix spike/matrix spike duplicate recoveries are outside of the control limits. Re-analysis of the pair confirm the initial recoveries. The initial analysis was reported.

The matrix spike/matrix spike duplicate for Aluminum, Calcium and Iron have recoveries outside of the control limits due to the element having a sample concentration greater than or equal to 4 times the concentration of the matrix spike.

CASE NARRATIVE - cont.

QUANTERRA PROJECT NUMBER 077428

Metals - Various Methods cont.

The thallium matrix spike/matrix spike duplicate have recoveries below the control limits. The re-analysis yielded recoveries within the control limits. The re-analysis was reported.

Analysis for thallium was performed by graphite furnace in order to achieve detection levels required by the QAPjP.

Inorganics - Various Methods

The Nitrate plus Nitrite laboratory control sample was mis-spiked at 12.5 mg/Kg due to a misinterpretation of the QAPjP.

The matrix spike/matrix spike duplicate recoveries were not calculated due to the sample value being 4 times the concentration of the matrix spike.

There were no other anomalies associated with this report.

QUANTERRA'S QUALITY ASSURANCE PROGRAM

Quanterra has implemented an extensive Quality Assurance (QA) program to ensure the production of scientifically sound, legally defensible data of known documental quality. A key element of this program is Quanterra's Laboratory Control Sample (LCS) system. Controlling lab operations with LCS (as opposed to matrix spike/matrix spike duplicate samples), allows the lab to differentiate between bias as a result of procedural errors versus bias due to matrix effects. The analyst can then identify and implement the appropriate corrective actions at the bench level, without waiting for extensive senior level review or costly and time-consuming sample re-analyses. The LCS program also provides our client with information to assess batch, and overall laboratory performance.

Laboratory Control Samples - (LCS)

Laboratory Control Samples (LCS) are well-characterized, laboratory generated samples used to monitor the laboratory's day-to-day performance of routine analytical methods. The results of the LCS are compared to well-defined laboratory acceptance criteria to determine whether the laboratory system is "in control". Three types of LCS are routinely analyzed: Duplicate Control Samples (DCS), Single Control Samples (SCS), and method blanks. Each of these LCS are described below.

Duplicate Control Samples. A DCS is a well-characterized matrix (blank water, sand, sodium sulfate or celite) which is spiked with certain target parameters and analyzed at approximately 10% of the sample load in order to establish method-specific control limits.

Single Control Samples. An SCS consists of a control matrix that is spiked with surrogate compounds appropriate to the method being used. In cases where no surrogate is available, (e.g. metals or conventional analyses) a single control sample identical to the DCS serves as the control sample. An SCS is prepared for each sample lot. Accuracy is calculated identically to the DCS.

Method Blank Results. A method blank is a laboratory-generated sample which assesses the degree to which laboratory operations and procedures cause false-positive analytical results for your samples.

LABORATORY ANALYSES:

- EXPLOSIVES (SW8330, SW8330-ADD-1, SW8330-ADD-2)
- NITRATE + NITRITE (E333.2)
- SEMI-VOCs (SW8270)
- ICP METALS (SW6010), MINUS LEAD, ARSENIC, SELENIUM, AND MERCURY
- MERCURY (SW7471)
- LEAD (SW7421), ARSENIC (SW7060), SELENIUM (SW7740)
- CYANIDE (SW9012)

CONTAINER TYPES:

- P - POLYETHYLENE
- CO - CLEAR GLASS
- AO - AMBER GLASS

FOR SOIL SAMPLES ONLY ONE 16-oz GLASS JAR OF SOIL AT
REQUIRED TO PROVIDE SUFFICIENT SAMPLE VOLUME FOR ALL
LYSES. THE REQUIRED ANALYSES FOR EACH SOIL SAMPLE
IDENTIFIED BY CHECKING THE APPROPRIATE BOXES (1-7)

QUANTERRA PROJECT NUMBER: 077507
PO/CONTRACT: 06

Mr. Jeff Johnson
Gram, Inc.
8500 Manual Blvd. NE, #B-370
Albuquerque, New Mexico 87112

Dear Mr. Johnson:

This report contains the analytical results for the nineteen soil samples which were received under chain of custody by Quanterra West Sacramento on 03 September 1994. These samples are associated with your McCormick Ranch, Kirkland AFB project.

The case narrative is an integral part of this report.

Partial preliminary results were sent via facsimile on 23 September 1994.

If you have any questions, please call me at (916) 374-4362.

Sincerely,

A handwritten signature in black ink, appearing to read "Diana L. Brooks", with a long, sweeping horizontal line extending to the right.

Diana L. Brooks
Project Manager

CASE NARRATIVE

QUANTERRA PROJECT NUMBER 077507

General Comments

The temperature blanks associated with your samples were recorded as 1.8 deg C and 9.8 deg C. The ambient temperatures were 3.2 deg C and 9.4 deg C. The samples (02660001 and 02960001) associated with the temperature of 9.8 deg C were canceled per your instructions.

Semivolatile Organics - Method 8270

Sample 02540001 matrix spike duplicate (Quanterra ID 077507-0010SD) has a Terphenyl-d14 surrogate recovery above the control limits. A re-injection of this sample confirmed the recovery. The initial injection was reported.

The matrix spike/matrix spike duplicate had several recoveries above the control limits. The samples were re-injected and the recoveries were confirmed. The initial injection was reported.

The laboratory control sample has benzoic acid reported as NA. The actual value recovered (43%) is within the control limits. Noted in the QAPjP, this compound is flagged for a variance.

Due to electronic deliverable limitations, the library search data is available in hardcopy format only.

Metals - Various Methods

The ICAP matrix spike/matrix spike duplicate for iron and manganese have %RPDs above control limits and antimony, barium and manganese recoveries outside of the control limits. Re-analysis of the pair confirm the initial recoveries and %RPDs. The initial analysis was reported.

The matrix spike/matrix spike duplicate for Aluminum, Calcium and Iron have recoveries outside of the control limits due to the element having a sample concentration greater than or equal to 4 times the concentration of the matrix spike.

CASE NARRATIVE - cont.

QUANTERRA PROJECT NUMBER 077507

Selected Metals - Various Methods cont.

The selenium matrix spike/matrix spike duplicate have recoveries above the control limits. The re-analysis yielded a matrix spike recovery within the control limit and a matrix spike duplicate recovery above the control limit. Because the recoveries for the re-analysis were more acceptable, the re-analysis was reported.

Analysis for thallium was performed by graphite furnace in order to achieve detection levels required by the QAPjP.

Inorganics - Various Methods

The Nitrate plus Nitrite laboratory control sample was mis-spiked at 12.5 mg/Kg due to a misinterpretation of the QAPjP.

The matrix spike/matrix spike duplicate recoveries were not calculated due to the sample value being 4 times the concentration of the matrix spike.

There were no other anomalies associated with this report.

QUANTERRA'S QUALITY ASSURANCE PROGRAM

Quanterra has implemented an extensive Quality Assurance (QA) program to ensure the production of scientifically sound, legally defensible data of known documental quality. A key element of this program is Quanterra's Laboratory Control Sample (LCS) system. Controlling lab operations with LCS (as opposed to matrix spike/matrix spike duplicate samples), allows the lab to differentiate between bias as a result of procedural errors versus bias due to matrix effects. The analyst can then identify and implement the appropriate corrective actions at the bench level, without waiting for extensive senior level review or costly and time-consuming sample re-analyses. The LCS program also provides our client with information to assess batch, and overall laboratory performance.

Laboratory Control Samples - (LCS)

Laboratory Control Samples (LCS) are well-characterized, laboratory generated samples used to monitor the laboratory's day-to-day performance of routine analytical methods. The results of the LCS are compared to well-defined laboratory acceptance criteria to determine whether the laboratory system is "in control". Three types of LCS are routinely analyzed: Duplicate Control Samples (DCS), Single Control Samples (SCS), and method blanks. Each of these LCS are described below.

Duplicate Control Samples. A DCS is a well-characterized matrix (blank water, sand, sodium sulfate or celite) which is spiked with certain target parameters and analyzed at approximately 10% of the sample load in order to establish method-specific control limits.

Single Control Samples. An SCS consists of a control matrix that is spiked with surrogate compounds appropriate to the method being used. In cases where no surrogate is available, (e.g. metals or conventional analyses) a single control sample identical to the DCS serves as the control sample. An SCS is prepared for each sample lot. Accuracy is calculated identically to the DCS.

Method Blank Results. A method blank is a laboratory-generated sample which assesses the degree to which laboratory operations and procedures cause false-positive analytical results for your samples.

ND = Not detected.

NC = Not calculated, calculation not applicable.

All results and spike amounts are reported on a dry weight basis.

All calculations are performed before rounding to avoid round-off errors in calculated results.

Potassium	2820	mg/kg	564	6010	13 SEP 94	20 SEP 94
Selenium	ND	mg/kg	0.56	7740	12 SEP 94	13 SEP 94
Silver	ND	mg/kg	5.6	6010	13 SEP 94	20 SEP 94
Sodium	ND	mg/kg	564	6010	13 SEP 94	20 SEP 94
Thallium	ND	mg/kg	0.50	7841	10 SEP 94	20 SEP 94
Vanadium	13.5	mg/kg	11.3	6010	13 SEP 94	20 SEP 94
Zinc	38.3	mg/kg	2.3	6010	13 SEP 94	20 SEP 94

Percent Moisture is 11%. All results and limits are reported on a dry weight basis.

Note 1 : Reporting limit raised as a dilution was performed because the initial post-digest spike recovery fell between 40% and 85% due to matrix interference.

ND = Not detected
NA = Not applicable

MEMORANDUM

DATE: October 5, 1994 3:48pm
TO: Jeff Johnson
FROM: Joe Schairer
RE: 077541

Jeff:

Here is the amended case narrative for Quanterra project 077541, which was forwarded to you on 28 September 1994. Also included are the Semivolatile Organics Library Search results.

Please remove the original case narrative from the report and replace it with the attached version. Insert the Library Search data sheets behind their respective sample data sheets.

If I can answer any questions, please call.

Thank you,

Joe

I-203

QUANTERRA PROJECT NUMBER: 077541
PO/CONTRACT: Jeff Johnson

Jeff Johnson
Gram, Inc.
8500 Menaul Blvd. NE, #B-370
Albuquerque, NM 87112

Dear Mr. Johnson:

This report contains the analytical results for the five aqueous samples which were received under chain of custody by Quanterra West Sacramento on 08 September 1994. These samples are associated with your McCormick Ranch, Kirtland AFB project.

The case narrative is an integral part of this report.

If you have any questions, please call me at (916) 374-4362.

Sincerely,

A handwritten signature in black ink, appearing to read "Diana L. Brooks for". The signature is fluid and cursive.

Diana L. Brooks
Project Manager

Laboratory Control Sample Report (LCS)

CASE NARRATIVE

QUANTERRA PROJECT NUMBER 077541

General Comments

Only one cooler was received with a temperature blank. The temperature of this blank was recorded at 4.9 degrees Centigrade. The ambient temperatures in the three coolers which samples were received in was recorded as 5.6 degrees Centigrade, 6.4 degrees Centigrade and 6.6 degrees Centigrade.

The pH of the sample in all preserved containers was checked upon receipt and found to be acceptable.

Specialty Explosives by HPLC/MS - Method 8321

The laboratory control sample (LCS) recovered nitroglycerin and PETN above the listed control limits. Presently, the laboratory has not generated enough LCS recovery data to calculate historical limits. Therefore, the control limits used have been designated advisory only. The elevated recoveries in the LCS provide confidence in the analysis ability to detect target analytes at the listed reporting level. Since the samples did not have positive detections of target analytes, the data was accepted.

Semivolatile Organics - Method 8270

The reported duplicate laboratory control sample (DCS) has five compounds with an average recovery above the listed control limits. All of the samples in this project did not have detections of target analytes. The high recoveries in the DCS provide confidence in the analyses ability to detect target analytes at a concentration above the reporting limit.

The sample group was extracted and analyzed with a DCS, as opposed to a MS/SD/LCS, due to limited sample volume.

Due to electronic data deliverable limitations, library search results are available in hardcopy format only.

QUANTERRA'S QUALITY ASSURANCE PROGRAM

Quanterra has implemented an extensive Quality Assurance (QA) program to ensure the production of scientifically sound, legally defensible data of known documental quality. A key element of this program is Quanterra's Laboratory Control Sample (LCS) system. Controlling lab operations with LCS (as opposed to matrix spike/matrix spike duplicate samples), allows the lab to differentiate between bias as a result of procedural errors versus bias due to matrix effects. The analyst can then identify and implement the appropriate corrective actions at the bench level, without waiting for extensive senior level review or costly and time-consuming sample re-analyses. The LCS program also provides our client with information to assess batch, and overall laboratory performance.

Laboratory Control Samples - (LCS)

Laboratory Control Samples (LCS) are well-characterized, laboratory generated samples used to monitor the laboratory's day-to-day performance of routine analytical methods. The results of the LCS are compared to well-defined laboratory acceptance criteria to determine whether the laboratory system is "in control". Three types of LCS are routinely analyzed: Duplicate Control Samples (DCS), Single Control Samples (SCS), and method blanks. Each of these LCS are described below.

Duplicate Control Samples. A DCS is a well-characterized matrix (blank water, sand, sodium sulfate or celite) which is spiked with certain target parameters and analyzed at approximately 10% of the sample load in order to establish method-specific control limits.

Single Control Samples. An SCS consists of a control matrix that is spiked with surrogate compounds appropriate to the method being used. In cases where no surrogate is available, (e.g. metals or conventional analyses) a single control sample identical to the DCS serves as the control sample. An SCS is prepared for each sample lot. Accuracy is calculated identically to the DCS.

Method Blank Results. A method blank is a laboratory-generated sample which assesses the degree to which laboratory operations and procedures cause false-positive analytical results for your samples.
